Assignment -2
Thought Problem

Issues we may face:
- The data provided to us may contain redundancy thus leading to inefficient rendering of code and occupation of excessive memory
- The data may not always help us in giving the best fit curve (if we were to plot trajectory),
- may not always be accurate subject to the measurement errors restrictions
- may not be sufficient to locate a planet or judge its ability to sustain life among various other factors
- The data may contain mismatch in the representation through units. Subject to the source the units may vary which will eventually lead pretty varied and unexpected results.
